

# CMBS Issuance Surges to Post-GFC Highs in the First Quarter

This report is excerpted from the *Second Quarter 2025 Fixed-Income Sector Views*.

## Elevated first quarter supply adds to technical risks in the sector.

CMBS new issuance volumes reached a post-global financial crisis (GFC) high in the first quarter. This supply was well-absorbed through March. Spreads widened slightly alongside other investment-grade credit sectors, but this modest correction did not slow issuance given the broadly supportive macroeconomic backdrop. Demand for commercial real estate lending capital from data center operators is expected to rise significantly, further increasing the likelihood of heavier CMBS supply. Maintaining credit discipline is essential as market technicals continue to pressure credit standards in the sector.

## Sector Commentary

- CMBS issuance more than doubled to \$42 billion in Q1, up from \$19 billion last year.
- Over \$26 billion in year-to-date issuance came from single asset/single borrower (SASB) transactions. Investors favor SASB deals for their unique risk exposure over traditional conduit CMBS.
- Office-backed SASB deal issuance exceeded all diversified conduit deals this quarter, showing strong investor preference for the SASB format.
- Substantial growth in data center SASB issuance is possible in upcoming quarters. First quarter data center issuance was limited due to headline risks like DeepSeek, causing a temporary pause. Consequently, office SASB issuance more than doubled data center CMBS issuance during this period.
- As AI infrastructure construction progresses, CMBS investors may have opportunities to invest in data center bonds.

## Investment Themes

- We maintain our preference for senior securities with higher credit enhancement, capable sponsorship, and limited exposure to legacy real estate issues, particularly in the office sector.
- Select SASB and CRE CLO transactions present opportunities for attractive risk-adjusted returns, as spreads remain relatively wide compared to more liquid corporate bonds.
- Conversely, we find that most mezzanine and junior bonds across CMBS subsectors do not adequately compensate investors at current levels.

**Investing involves risk, including the possible loss of principal.** In general, the value of a fixed-income security falls when interest rates rise and rises when interest rates fall. Longer term bonds are more sensitive to interest rate changes and subject to greater volatility than those with shorter maturities. During periods of declining rates, the interest rates on floating rate securities generally reset downward and their value is unlikely to rise to the same extent as comparable fixed rate securities. High yield and unrated debt securities are at a greater risk of default than investment grade bonds and may be less liquid, which may increase volatility. Investors in asset-backed securities, including mortgage-backed securities and collateralized loan obligations ("CLOs"), generally receive payments that are part interest and part return of principal. These payments may vary based on the rate loans are repaid. Some asset-backed securities may have structures that make their reaction to interest rates and other factors difficult to predict, making their prices volatile and they are subject to liquidity and valuation risk. CLOs bear similar risks to investing in loans directly, such as credit, interest rate, counterparty, prepayment, liquidity, and valuation risks. Loans are often below investment grade, may be unrated, and typically offer a fixed or floating interest rate.
